

VITREOUS CHINA FACTS AND CARE

Vitreous China is a Ceramic material that has been glazed with enamel. When an intense amount of heat is applied to powdered glass, the result is a liquid called vitreous enamel that can be used to coat small objects such as sinks and toilets. Vitreous China has a smooth, shiny surface that won't stain or fade and resists scratches and abrasions. It is also chemical resistant and impossible to burn.

Care and Maintenance

Vitreous china is very easy to care for. Simply rinse thoroughly with a mild liquid non-abrasive detergent such as dishwashing liquid, then make sure you wipe dry with a soft cloth. A mild abrasive cleaner may be used for more heavy duty cleaning. Use toilet bowl cleaners inside of the bowl only. Do not use in-tank cleaners as they can damage the flush valve. Strong abrasive cleaners or pads will remove the gloss or matte finish and scratch and dull the surface. Avoid soft-scrub type of cleaner on a regular basis
